

EDSGN 498A: New Course in Solar Electrical System Design

The Center for Sustainability is piloting a new 3-credit course in solar PV systems design and construction. The course will focus upon the design aspects, system components, and construction issues of photovoltaic power systems. The class will be offered as an online course format, and will include a hand-on workshop in solar system installation, assembly, and trouble shooting. This course is being developed through a joint effort with the National Joint Apprenticeship Training Centers (NJATC) which provides training for certified electricians across the U.S.
